Advanced pump system controller for parallel connected pumps for HVAC and Pressure Boosting Applications

Compatibility

The CU 352 pump controller can control up to six (6) parallel connected pumps in the following manner:

- Direct BUS control: CRE, CME, VLSE or LCSE pumps
- Direct BUS control: Pumps with Grundfos **CUE** drives
- Digital/Analog control: Pumps with external drives (requires IO 351B Input/Output module)

HVAC Control Modes

- o Constant Differential Pressure control via remote sensor
- Multi-zone Differential Pressure control up to 6 zones
 - Priority, Minimum or Energy Saving Mode
- o Quadratic, proportional or constant differential pressure control via local sensor
 - Adjustable control curve (Max flow and control head)
 - Efficiency based sequencing automatically updated
- o Constant Flow
- o Constant Temperature
- o Constant Differential Temperature

Pressure Boosting Control Modes

- o Constant Pressure (pump discharge)
- o Quadratic or Proportional discharge pressure
 - Adjustable control curve (Max flow and min. static head)
- o Constant Pressure (remote sensor)

Pump Cascade Control

- o Efficiency based pump sequencing
 - * Updated automatically when setpoint and/or control head are changed
- o Automatic Pump alternation (run hour based)
- o Standby Pumps (single or multiple)
- o Adjustable minimum time between starts / stops
- o Adjustable maximum starts per hour
- o Pump test run (exercise idle pumps)
- o Clock program
- o Proportional Gain and Integral Time adjustment

Application optimized functions:

- o Secondary (Fallback) Sensor
- o Pump curve data (5th or 2nd order polynomial)
 - * Pre-programmed from factory
- Flow estimation via pump curve data and pressure measurement across pump(s)
- o Reduced operation (generator backup power)

 Max. kW limit or max. number of pumps
- o Specific energy calculation (kWh per unit volume)*requires flow sensor input
- Low Flow Stop (Pressure Boosting)
 Adjustable low flow setting: Energy saver mode, medium flow or high comfort level

Protection and Monitoring

- o Check valve failure detection (MLE motors)
- o Pump outside duty range protection*keeps all operating pumps on their curve
- o Low suction pressure warning and alarm
- o Primary sensor failure reaction setting
- o Soft pressure build-up (Pipe fill mode)
- o Low system pressure warning and alarm
- o High system pressure shutdown
- o Alarm log, last 24, time stamped
- Data log graph (20 3600 samples/hour)
 (Flow, speed, setpoint, sensor feedback, kW)
- o BMS/EMS communication (see page 4)

Page 2

CU 352 Control user interface

Sequence of operation

Hydronic Circulation

The system controller shall operate equal capacity variable speed pumps to maintain a variable (quadratic or linear) or constant differential pressure. The system controller shall receive an analog signal [4-20mA] from a remote or pump system mounted differential pressure sensor. The controller shall be able to receive a system suction pressure and system discharge pressure to determine the system differential pressure (two independent analog signals). The controller shall have the means to protect pumps against dry running via a user defined low suction pressure setting.

Pressure Boosting

The system controller shall operate equal capacity variable speed pumps to maintain a constant or variable (quadratic or linear) pressure. The system controller shall receive an analog signal [4-20mA] from a remote or pump system mounted pressure sensor. The controller shall be capable of simulating the effect of a remote mounted pressure sensor by quadratically reducing the system discharge pressure setpoint as a function of reduced flow (friction loss compensation).

Cascade Control

Standard Cascade Control (Pumping Efficiency Based):

The pump system controller shall adjust pump speed as necessary to maintain system set-point pressure as flow demand changes. The pump system controller shall start additional pumps upon determination of an increase in efficiency utilizing factory programmed (5th order polynomial) curve data. When the system pressure is equal to the system set-point, all pumps in operation shall reach equal operating speeds. The pump system controller shall have field adjustable Proportional gain and Integral time (PI) settings for system optimization.

Optional Cascade Control (Pump Start Speed Based):

As flow demand increases the pump speed shall be increased to maintain the system set-point pressure. When the operating pump(s) reach the programable start speed, an additional pump will be started and will increase speed until the system set-point is achieved. When the system pressure is equal to the system set-point, all pumps in operation shall reach equal operating speeds. The pump system controller shall have field adjustable Proportional gain and Integral time (PI) settings for system optimization.

Pumps outside duty range (End of curve protection):

When the pumps are outside their allowable operating range, the controller shall switch on an additional pump, distributing a reduced flow through all pumps in operation moving each pump back into its allowable operating region.

Pump Alternation

All pumps in the system shall alternate automatically based on demand, time and fault. If flow demand is continuous with only one pump in operation, the system controller shall have the capability to alternate the pumps every 24 hours, every 48 hours or once per week. The interval and actual time of the pump change-over shall be field adjustable.

Low Flow Stop (Pressure Boosting)

The system controller shall be capable of detecting low flow allowing for pumps to be switched off in an energy saving mode. Upon detection of low flow, the controller shall increase the system setpoint by 5% (adjustable) to store water in a diaphragm or bladder tank and switch off. The pump shall remain off until the system pressure falls 5% below the system setpoint (adjustable). If system flow is still low when the pump switches back on, the pump shall refill the diaphragm tank to 5% above setpoint and switch off again. If system flow increases above the low flow setting, the pump shall return to normal constant pressure mode maintaining the system setpoint.

Page 3

Technical data

Altitude above sea level

Maximum 6,560 feet (2000 m.)

Ambient Temperature

During operation: $-4^{\circ}F$ to $+140^{\circ}F$ ($-20^{\circ}C$ to $+60^{\circ}C$) During transportation: $-4^{\circ}F$ to $+140^{\circ}F$ ($-20^{\circ}C$ to $+60^{\circ}C$)

- * At temperatures below 32°F (0°C) the display may react slowly.
- * The display should not be exposed to direct sunlight

Relative air humidity

5 to 95%

Enclosure class

UL type 3R when mounted in the front of a panel with UL type rating 1, 2, 3, 3R, 5, 12, 12K or 13. Overall control panel rating of Type 4/4X available on request.

Supply voltage

1 x 100-240 VAC +/- 10% 50/60Hz, PE (Class 1 equipment)

Power consumption

Maximum 22 W

Backup battery

The optional backup battery can keep the CU352 powered during intermittent power outages.

The CU 352 will monitor the following:

- short circuit
- wrong polarity
- · defective battery
- battery missing
- low battery voltage

Digital inputs (3)

| Open-circuit voltage | 24 VDC |
|------------------------|----------|
| Closed-circuit current | 5 mA, DC |
| Frequency range | 0-4 Hz |

Analog inputs (3)

| | 0-20 mA |
|---------------------------|-----------------------|
| Input current and voltage | 4-20 mA |
| | 0-10 V |
| Tolerance | ± 3.3 % of full scale |
| Repetitive accuracy | ± 1 % of full scale |
| Input resistance, current | < 250 Ω |
| Input resistance, voltage | > 50 kΩ ± 10% |
| | 24 V, 30 mA |
| Supply to sensor | short-circuit |
| | protected |

Relay outputs (2)

| Normally open contacts | C, NO | | |
|------------------------|--------------|--|--|
| Maximum contact load | 240 VAC, 2 A | | |
| Minimum contact load | 5 VDC, 10 mA | | |

Communication protocols

For connection to building management systems, Communication Interface Modules (CIM) can be supplied with the CU 352 controller.

Protocol CIM Type

| | - /1 |
|--------------|------|
| LONworks | 110 |
| PROFIBUS DP | 150 |
| PROFINET IO | 500 |
| Modbus RTU | 200 |
| Modbus TCP | 500 |
| BACnet MS/TP | 300 |
| BACnet IP | 500 |
| Ethernet IP | 500 |

MLE

Product compatibility

- Multi-stage: CRE, CRIE, CRNE, MTRE, MTSE, SPKE, CME
- Single-stage: TPE2, TPE3, VLSE, LCSE
- **Systems**: Hydro MPC-E, Hydro Multi-E, Hydro Multi-B, Hydro Solo-E, CMBE home booster.

MLE is a dedicated motor-drive system for pumps and other applications. Pumps equipped with MLE motors overcome application challenges and save energy in a variety of pump installations in order to reach the lowest Life Cycle Cost (LCC) possible.

Integrated drives

Integrated drives are beneficial because they are installed on non-controlled pumps at no additional installation cost. Once the power supply is connected and the pump is fitted into the pipe system, they are ready to operate at the desired setpoint.

Operating pumps with MLE also reduces CAPEX (capital expense) of additional cabinets, components and facility space by having the entire pump system in line with the pipe system.

MLE is the result of Grundfos' efficient motor technology and it is an efficient IE5 motor, with an efficiency much higher than NEMA Premium, which minimizes OPEX (operating expense).

Robustness throughout the system

The Grundfos full line supply of components, from the power supply to pipe fittings, provides the most robust solutions:

- Built-in protection against power supply disturbances, environment and motor load.
- MLE is designed to mitigate bearing currents.
- · No cooling fans in drive (wear part).

MLE product range

| 1 x 200-240 V | 0.33 - 2.0 HP | |
|---------------|---------------|--|
| 3 x 200-240 V | 1.5 - 7.5 HP | |
| 3 x 440-480 V | 0.33 - 15 HP* | |

Up to 30 HP available with different specifications.

Features and benefits

| Feature | Benefit |
|---|--|
| Арр | lication control |
| Control modes | Easy commissioning to match system design criteria. |
| Multipump function including alternating, back-up, or cascade | Neglects the need for external controllers and continuous operation by redundant pump and sensor if either component fails. |
| Differential pressure or temperature with 2 sensors | Lower CAPEX by common inexpensive sensor types. |
| Pump curve adjustments and run at power limit | Stabilizes unstable pump curves and extends operating range. |
| Setpoint influence | Adapts QH to internal or measured values. |
| Energy sa | aving for lower OPEX |
| AUTOADAPT or FLOWLIMIT | Continuously adapts to the most efficient curve and reduces pressure loss in the system. |
| Low-flow stop function | Improved energy optimization and comfort. |
| ECM motor that exceeds the NEMA Premium efficiency levels | ECM motors have significantly lower motor loss than NEMA Premium motors. This alone reduces energy consumption by 10 % with a typical pump load profile. |
| Cond | lition monitoring |
| Limit Exceed function | Any value can be supervised to protect the system. |
| Loss of prime and dry run | Protects the shaft seal. |
| Cavitation protection | Protects the impellers. |
| Flow estimate and heat energy monitor | Monitoring of the heating system's performance. |
| Overload and temperature | Protects the frequency converter and motor. |
| Stop at minimum speed | Protects the pump and saves energy. |
| Motor bearings monitors | Ensures uptime by preventive maintenance. |
| | Robustness |
| Operating temperature between -4 and +140 °F | Allows installation almost anywhere and high margins in control rooms, resulting in longer product service life. |
| Impulse transient resistance (VDE0160 compliant) | Resistance against lightning, ESD, switching impulses and utility fault clearing. |
| Interruptions and voltage sags (SEMIF47 compliant) | Keeps process running and derates the pump to the available power. |
| Line harmonics resistance (EN 61000-4-13, class 3) | Built-in compensation of disturbance to avoid overheating of motor windings and maintaining a steady pump operation. |
| Built-in RFI filters | Neglects the need for external components. |
| NEMA3 / NEMA4 enclosures | Installed in-line to pipe systems at no added cost. |

Grundfos iSOLUTIONS

Grundfos iSOLUTIONS delivers the optimal combination of pumps, drives and auxiliary components for the specific application, incorporating special features and functions, and building on application knowledge and experience.

Grundfos iSOLUTIONS allows easy integration of pumps, drives, measurements, controls, protections, and communication, saving you valuable engineering, installation and commissioning time.

To learn more, visit: www.grundfos.com/isolutions

Sensors

MLE is sensor-independent and controls the pump to any measured feedback.

Grundfos offers several sensors to be used in pump solutions:

- pressure sensors
- temperature sensors
- · differential pressure sensors
- · differential temperature sensors
- · flow meters.

Grundfos GO Remote

Grundfos GO Remote for iOS and Android ensures easy and quick commissioning, monitoring and servicing of pumps with MLE motors.

Vibration Isolation

Common vibration concerns with frame mounted end suction pumps

- Misalignment between motor shaft and pump shaft is the #1 source of pump vibration
 - End suction pumps typically have large over-hung impellers with high rotating inertia, that when misaligned creates large unbalanced forces and results in vibration
 - o Offset discharge throat of the volute creates the radial load
 - o Decreased component life
- End suction pump bearing loading is primarily from radial forces

Grundfos CR Multistage pump benefits:

- Register fit between motor and pump
- No alignment required for lifetime of operation
- Minimized vibration
- Longer component life
- Quiet operation (product lubricated pump bearings)
- CR Multistage pumps offer the lowest rotating inertia compared to most other pumps in same duty conditions
- Low rotating inertia equals less opportunity for vibration
- Multistage pump bearing loading is on average 10% radial and 90% axial forces

No alignment is required

Pump systems with Grundfos CR(E) Multistage pumps

- Vibration Isolation:
 - o 1/2" thick dampeners at pump base mounting points (4 per pump)
 - o Inertia bases and grouting are not required when mounted to concrete housekeeping pad
 - Flexible connectors on manifold connections are recommended
